1962. Realization of the first Soviet turbogenerator of 100 000 kV, 3 000 r.p.m. KRIZHANOVSKIY, V. A. Zh-At. Sv., 19 (No. 9) 11-15 (1962). In Russian.—A report on the removal of operational faults in the turbogenerator, and their removal. The most delicate parts were the main bearings where every few months staining and later cracking of the babbit were detected. Vibration of the main bearings continued to rise dangerously and could not be eliminated by repeated dynamic balancing. After total overhaul of the rotor and again repeated balancing the vibrations were brought under control. A cut-out relay operating on the axial shift of the high-pressure rotor was also mounted. S. TITLE: On the Yield of Rare Earths on the Occasion of the Fissioning
of Pu²³⁹ by Reactor Neutrons. (Russian)

PERIODICAL: Atomnaya Energiia, 1957, Vol 2, Nr 3, pp 276 - 277 (U.S.S.R.)
Received: 4 / 1957 Reviewed: 4 / 1957

ABSTRACT: At first some previous works dealing with this subject are discussed. Also the authors of this work determined the yields of the fission products of Pu²³⁹ mass-spectrometrically. On this occasion the precipitation of the nitric acid plutonium solution and its fission products were subjected to direct mass-spectroscopic investigation.

The values thus obtained of the relative yields of the isotopes of cerium, neodymium, samarium as well as of cesium are shown together in tables and compared with data obtained by D.WILES et al., Can.J.Chem. 34, 227 (1956). Agreement is good in all cases with the exception of Ce¹⁴⁰ and Cs¹³³. The by far lower value for the yield of Cs¹³³ found here can be explained by contamination by natural cesium in the experiments carried out by WILES as well as by the partial loss of the predecessors of Cs¹³³ (viz. of Xe¹³³) in the experiments investigated here. Such an explanation is, however, not suited for Ce¹⁴⁰, because among its predecessors long-lived, gaseous or volatile elements are lacking.

Card 1/2

PA - 2311

On the Yield of Rare Earths on the Occasion of the Fissioning
of Pu²³⁹ by Reactor Neutrons.

A detailed discussion of results from the point of view of the theory by A.C.PAPPAS must be deferred until the end of the additional experiments. In spite of this the existence of a fine structure within the domain of the masses 135 - 137 can be taken for granted if Pu²³⁹ is fissioned by thermal neutrons. Three tables contain the relative yields of the isotopes of cerium and neodymium, samarium as well as of cesium. (1 illustration and 3 tables).

TITLE: Sr⁹⁰ and Sr⁸⁸ Yields in the Pu²³⁹ Fission by Reactor Neutrons
(Vyklydy Sr⁹⁰ i Sr⁸⁸ pri delenii Pu²³⁹ reaktornymi neytronami)

PERIODICAL: Atomnaya Energiya, 1958, Vol. 4, Nr 1, pp. 77-79 (USSR)

ABSTRACT: By means of a mass spectrometer the yields of Sr⁹⁰ and Sr⁸⁸ were determined after the Pu²³⁹ sample had been exposed to an integral neutron flux of $2,7 \cdot 10^{20}$ neutrons. The strontium ratio measured was: Sr⁹⁰ : Sr⁸⁸ : Sr⁸⁶ = 1 : (0,687±0,005) : (0,0094±0,004)
If this measurement is carried out following the known absolute yield of Nd¹⁴³ with 5,98%, the following absolute yields are obtained in %: Sr⁹⁰ 2,28
Sr⁸⁸ 1,35

TITLE: Mass Numbers of Dysprosium Isotopes With a Neutron Deficit
(Massovyye chisla neytronodefitnykh izotopov disproziya)

PERIODICAL: Izvestiya Akademii nauk SSSR, Serija fizicheskaya, 1958,
Vol. 22, Nr 7, pp. 815 - 816 (USSR)

ABSTRACT: When the authors investigated the Dy-fraction and the genetic relations of the Dy-isotopes with their daughter elements (Tb and Gd), they arrived at the conclusion (Ref 4) that isotopes with a mass number of 159, 157, 155, and 153 must be contained in the Dy-fraction. In order to check on this assumption it was attempted to determine directly the masses of the Dy-isotopes, which are produced in a "thorough" (glubok) Ta-fission reaction. For this purpose the Dy-fraction was separated in the mass spectrometer. The μ -spectra of the separated Dy-isotopes were recorded with a scintillation spectrometer. A MC-2 industrial-type mass spectrometer was used for the separation. In order to increase the intensity

Card 1/3

SOV/48-22-7-9/26
Mass Numbers of Lysprosium Isotopes With a Neutron Deficit

of light the slits were somewhat widened and the tungsten filament cathode was platinated. The preparations were investigated on a γ -scintillation spectrometer with a NaJ(Tl)-crystal with a size of 30 x 20 mm. Radioactive isotopes of Dy with a mass number of 159, 157, 155, 153, and probably of 151 were found. The low activity of the Dy¹⁵⁹-sample, and the very low one of the Dy¹⁵¹-sample did not permit a further investigation. From the evidence collected the following conclusions could be drawn: Dy¹⁵⁷: half-life $T_{1/2} = 8,5 \pm 0,5$ hours. A radioactive daughter substance was not found. The γ -spectrum shows 80- (weak) and 325 keV-lines. Dy¹⁵⁵: $T_{1/2} = 9 \pm 2$ hours. A radioactive daughter substance with a half-life of about 5 days (Tb¹⁵⁵, Refs 4 and 6) was found. The γ -spectrum of Dy¹⁵⁵ consists of 80- (dubious) and 227 keV-lines: Dy¹⁵³: $T_{1/2} = 7 \pm 3$ hours. A radioactive daughter substance with a half-life of about 2 days (Tb¹⁵³, Ref 7) was found. The γ -spectrum of

TITLE:

Mass-spectrometric determination of the yield of fission fragments of heavy nuclei and of the products of some other nuclear reactions

SOURCE:

Tashkentskaya konferentsiya po mirnomu ispol'zovaniyu atomnoy energii. Tashkent, 1959. Trudy. v. 1. Tashkent, 1961, 222-228

TEXT: A mass-spectrometric study of the yield of Pu^{239} fission fragments is reported. A PuO_2 sample of 75.3 mg weight was sealed in a quartz ampoule and subjected to a flux of $2.7 \cdot 10^{20}$ neutrons/cm². The neutron flux was determined from the yield of $Co^{59}(n\gamma)Co^{60}$ reactions (Yuz, D. Neytronnyye issledovaniya na yadernykh kotlakh (Neutron studies in nuclear reactors), IA, 1954). The Co^{60} activity was measured with an error of $1 \pm 2\%$ of a 4π counter and by a comparison of its gamma activity with that of a standard radium preparation (Aglintsev, K. K. Dosimetriya yadernykh izlucheniy (Dosimetry of nuclear radiations), 1957). A correc-

tion for the self-absorption of neutrons in the Pu target was introduced. The irradiated PuO_2 sample was "cooled off" within 7.5 months and then dissolved in 62% HNO_3 , to which some drops of 40% HF were added (solution I). The part of the sample sealed in the quartz ampoule was subjected to the same treatment (solution II). Nevertheless, 15% of the plutonium was lost. The analyses of the two solutions showed the same results. The investigation was carried out with an MW-1301 (MI-1301) mass spectrometer (resolution 300, sector with $92^\circ 46'$). The absolute integral yield of fission fragments was determined by the isotope-dilution technique. Enriched stable isotopes, such as Ba^{136} , were used if required. It was thus possible to determine the yield of Cs, Nd, Sm, Ce, Ba, and Sr isotopes. The yield of monoisotopic elements of praseodymium was obtained by a comparison with a standard solution. The results are summarized in Tables 1 and 2. A mass-spectrometric analysis of the isotopic composition of samarium revealed the presence of Sm^{148} which is not due to natural samarium impurities since Sm^{144} would be present in this case. The absence of Sm^{144} indicates that Sm^{148} appears as a result of a secondary reaction. Contrary to what had previously been assumed on

Card 2/*K*/*4*

Mass-spectrometric determination ...

the basis of radiochemical measurements, it has been found that the section of heavy fission fragments of the curves for the yield of fission fragments of two fissile nuclei with different masses also exhibits a shift of the maximum. With the aid of the new technique, the neutron-deficient isotopes of dysprosium with $A = 159, 157, 155, 153$, and 151 could be discovered and their radioactive characteristics determined. The isotopes with $A = 155, 153$, and 151 have been unknown so far. There are 3 figures, 3 tables, and 8 references: 3 Soviet and 5 non-Soviet. The four most important references to English-language publications read as follows: Ref. 4: Case, K., Hofman, F., Placzek, G. Introduction to the theory of the neutron diffusion, v. 1, Los. Alamos, 1953; Ref. 5: Ingram, M. J. Phys. Chem., 57, 809, 1953; Ref. 7: Wiles, D., Petruska, J., Tomlinson, R., Can. J. Chem., 34, 227, 1956; Ref. 8: Fleming, W., Thode, H., Can. J. TITLE: On magnitude of quadrupole interaction between Si^{119m} nuclei and the crystal lattice

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 43, no. 6(12), 1962, 2050 - 2052

TEXT: The authors investigate the discrepancies observed between other authors' results (e.g. ZhETF, 40, 713, 1961; 41, 1347, 1961; 41, 1767, 1961 and Proc. Phys. Soc., 77, 1062, 1960; Phys. Rev., 123, 179, 1961; 120, 2211, 1960) concerning measurements of the quadrupole interaction between the Sn^{119m} nucleus and the crystal lattice. The experimental values of the resonance absorption line widths $2\Gamma_{\text{exp}}$ varied between 0.9 and 1.8 mm/sec and the splitting constants Δ between $3 \cdot 10^{-8}$ ev and $(11.0 \pm 1.5) \cdot 10^{-8}$ ev. The authors of the present paper used as source a 7.15 mg/cm² thick β -Sn foil (0.1% Sn¹¹²; 2.3% Sn¹¹⁹; 94% Sn¹¹⁸) irradiated by a neutron beam of integral flux $2.1 \cdot 10^{20}$ neutrons/cm². β -Sn foils of several thicknesses

On magnitude of quadrupole...

and other Sn compounds were used as absorbing media. The source as well as the absorption medium were kept at a temperature of $T = 83^{\circ}\text{K}$. The results for several absorbing media are tabulated. The data from evaluation of the quadrupole splitting in the β -Sn lattice show good agreement with the Western papers and are in contradiction to the Soviet papers cited. It is concluded that the discrepancy may be due to instrumental splitting of the line measured. There are 3 figures and 1 table.

TITLE: Investigation into the Mössbauer effect in tin compounds

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 147, no. 1, 1962, 127 - 130

TEXT: The Mössbauer effect in the symmetrical compounds SnCl_4 , SnBr_4 ,
 SnI_4 , $\text{Sn}(\text{C}_6\text{H}_5)_4$ and SnO_2 and in the asymmetrical compounds Ph_3SnHal
($\text{Ph} = \text{C}_6\text{H}_5$, Hal = F, Cl, Br, I) was studied using an apparatus in which the
absorber moved uniformly with respect to the source and an apparatus with
sinusoidal movement. β -Sn or SnO_2 were used as sources of the 23.8-kev
gamma-quanta (Sn^{119m}). With the symmetrical compounds the chemical shift δ
of the absorber lines with respect to β -Sn, expressed in mm/sec
($1\text{mm/sec} = 7.9 \cdot 10^{-8}$ ev), was a linear function of the electronegativity of
the atoms bound to Sn. The equation $\delta = 1.6 \cdot 10^{-29} [\left| \psi_s(0) \right|^2_{\text{absorb}} - \left| \psi_s(0) \right|^2_{\text{emit}}] \Delta R/R_{\text{ev}}$

given by A. J. F. Boyle, D. S. P. Bunbury, C. Edwards (Proc. Phys. Soc., 79, 416(1962)) and the data on the ionicity of the Sn-Hal bonds, obtained by the method of A. L. Schawlow (J. Chem. Phys., 22, 1211 (1954)) and those of M.M. Yakshin et al. (ZhNKh, 6, 2425(1961)) on refraction and dielectric constant give $\delta_{\text{ion}} = -(5.6 \pm 0.5) \text{ mm/sec} = -(4.4 \pm 0.4) \cdot 10^{-7} \text{ ev}$, $\Delta R/R(\text{Sn}^{119}) = +(1.9 \pm 0.2) \cdot 10^{-4}$ for a completely ionized bond. These data enable $|\psi_{1s}(0)|^2$ to be determined directly from δ . In the asymmetrical compounds, asymmetrical doublets were observed (Fig. 2) similar to those found by Boyle et al. in SnF_4 . The asymmetry was found also in dissolved compounds and cannot be explained by a random orientation of the crystals in the direction of the gamma quanta or by ferromagnetic or paramagnetic impurities. From the equation

$$\frac{\sigma_{13 \text{ norm}}}{\sigma_{11 \text{ norm}}} = \frac{\int_{-1}^{+1} [2 \sqrt{5} \bar{P}_0(\cos \theta) + \bar{P}_2(\cos \theta)] / (\cos \theta) d \cos \theta}{\int_{-1}^{+1} [2 \sqrt{5} \bar{P}_0(\cos \theta) - \bar{P}_2(\cos \theta)] / (\cos \theta) d \cos \theta}, \quad (3)$$

where the subscript norm = total, $\bar{P}_L(\cos \theta)$ is the normalized Legendre Card 2/5

B101/B144

polynomial, $f(\cos\theta) = \sum a_k \bar{P}_k(\cos\theta)$ is the factor determining the intensity of the Mossbauer line, a_k the decay coefficient, it follows that if $\sigma_{13 \text{ tot}}/\sigma_{11 \text{ tot}} = (2\sqrt{5}a_0 + a_2)/(2\sqrt{5}a_0 - a_2) \neq 1$ (with $a_2 \neq 0$) and $-2\sqrt{5} < a_2/a_0 < 2\sqrt{5}$, each of the peaks of the Mossbauer doublet may become higher than the other one according to the ratio a_0/a_2 . This ratio can be determined experimentally. Assuming a quadrupole splitting of the Mossbauer line in SnF_4 and Ph_3SnHal , $q = 6.9 \cdot 10^{18} x \text{ v/cm}^2$ is obtained where $q = \partial^2 v / \partial z^2$ is the gradient of the electric field in the region of the Sn^{119} nucleus, and x is the degree of ionization of the bond. For Ph_3SnHal $x \approx 0.55$ with $\text{Hal} = \text{I}$; $x \approx 0.7$ with $\text{Hal} = \text{Br}$; Cl and $x \approx 1$ with $\text{Hal} = \text{F}$. Another possible interpretation of the asymmetrical splitting might be the different hybridization of the sp^3d^2 bonds. In order to explain this problem it is suggested that the effective charges of the halogen and tin atoms be determined directly. When an equimolecular mixture of SnPh_4 and SnI_4 was irradiated with 1.6-Mev electrons the Mossbauer spectrum was

Card 3/5

Investigation into the...

S/020/62/147/001/018/022
B101/B144

observed to be greatly changed through the spectra of various disproportionation products $\text{Ph}_3\text{SnI}_{4-i}$ being superimposed. Hence it is concluded that the Mossbauer effect can be used not only to study the chemical structure but also to solve problems of chemical kinetics and radiation chemistry. There are 2 figures.

ABSTRACT: The gamma spectra of Br isotopes, obtained in the reaction of Cu(C¹², xn)Br, have been investigated with the aid of a scintillation spectrometer. Energies and relative intensities have been measured for a number of new γ -lines in bromine with the decay half-times 36 +1 and 4 +1 min. The energies and relative intensities are given for γ -lines with $T_{1/2} = 36$ min. The isotope with $T_{1/2} = 36$ min was identified as Br⁷⁴. A diagram of the lower energy levels in Se⁷⁴ is given in the original article. The authors thank G. N. Flerov for his

TITLE: Column theory of an arc discharge

PERIODICAL: Zhurnal tekhnicheskoy fiziki, v. 32, no. 2, 1962, 185-191

TEXT: The author develops a phenomenological theory of a simple model of the column of a skady high-pressure arc discharge. The arc plasma is regarded as a mixture of electrons, singly charged ions, and neutral atoms. The peripheral, weakly ionized region of discharge is neglected. The temperature distribution $T_i = T(r_i)$ is determined from the degree of ionization at the boundary of the discharge channel with the aid of the Saha equation. Since at high pressure dipolar diffusion is weak, the existence of a local thermodynamic equilibrium necessary for the application of the Saha equation is fulfilled. When determining the degree of ionization at the boundary of the current-carrying region, the electrical conductivity must be taken into account as a function of temperature and electron concentration. It is demonstrated that the electrical conductivity in the column is determined by the Coulomb interaction of the

(Card 1/3) X

34207
S/057/62/032/002/008/022
B104/B102

electrons and ions. The electrical conductivity is independent of the electron density. The heat transfer in the column is regarded as consisting of emission and heat conduction. Emission from the volume of a positive column consists of bremsstrahlung and recombination radiation. It is shown that in sufficiently strong arcs the contribution of emission to the thermal equilibrium is small. At temperatures higher than 2 ev and degrees of ionization of 0.1 to 0.15 not only classical heat conduction but also electronic heat conduction and ionization energy transfer have to be considered. The temperature and ionization limits are sought within which only classical heat conduction need be considered both in the column and in the shell. The effect of the boundary conditions on the discharge characteristics is studied in detail. The author thanks L. E. Tayrlin for valuable discussions and advice, and V. Ye. Golant for consultations. TITLE: On the theory of the current-voltage characteristic of the column of a high
 pressure nonstationary arc discharge

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 35, no. 10, 1965, 1882-1888

TOPIC TAGS: electric arc, alternating current, dynamic system, energy theory, gas
 discharge plasma, mathematic method, circuit breaker

ABSTRACT: The purpose of this paper is to derive a useful approximation for the dynamic current-voltage characteristic of a nonstationary high-pressure alternating current arc. The calculations are based on the heat balance equation with the assumptions of axial symmetry, constant pressure, and fixed temperature on the boundary. The temperature integral S of the heat conductivity and the temperature integral N of the heat capacity are introduced as new variables in accord with the proposals of G. Schmitz (Zs. Natur., 5a, 571, 1950) and H. Maccker (Zs. Phys. 157, No. 1, 1, 1959). Approximate analytic expressions are introduced for the electric conductivity of the plasma, the radiation loss, and the quantity N as functions of S . Different expressions are possible and the merits of several are briefly discussed. A solution for S is

Card 1/2

UDC: 537.523.5

L 7723-66
ACC NR: AP5025904

is assumed in the form of a product of an unknown function of time by a Bessel function of the radius. This solution is substituted into the heat balance equation and the equation is averaged over the radius. There results an approximate equation for the unknown function of time from which the dynamic current-voltage characteristic is derived. The behavior of the arc can be calculated by solving the dynamic current-voltage characteristic simultaneously with the equation for the external circuit. An expression is also derived for the thermal time constant of the arc as a function of the current. The approximation introduced by separating the variables and averaging the heat balance equation over the radius can be improved by assuming a solution in the form of a sum of several terms, in each of which the variables are separated and the radial dependence is specified, and then averaging over a corresponding number of separate radial regions. The author speaks of this procedure as a method of successive approximation, although the calculation of the n-th approximation does not depend on the previous calculation of the lower order approximations. The author thanks B.Ya.Temkin for valuable discussions. Orig. art. has: 27 formulas and 1 figure.

AUTHOR: KRIZNIC, D.A.
TITLE: Quantum Corrections to the THOMAS-FERMI Equation (Kvantovye
popravki k uravneniju Tomasa-Fermi, Russian).
PERIODICAL: Zhurnal Eksperimental'noi i Teoret. Fiziki, 1957, Vol 32, Nr 1,
pp 115-123 (U.S.S.R.)
Received: 3 / 1957
Reviewed: 4 / 1957

ABSTRACT: The present paper supplies a consistent quantum-mechanical derivation of the quantum corrections of the second and fourth order (with respect to \hbar) from the equations by HARTREE-FOCK. The operator-like formulation of the problem should be used. Neglecting the non-commutability of the operators of the potential and of the kinetic energy, the THOMAS-FERMI and THOMAS-DIRAC equations are derived. The quantum corrections correspond to the consideration of these operators, in which case the corrections of higher order are connected with the complicated operators.
First the operator-like formulation of the HARTREE-FOCK equations is discussed. The quantum-mechanical equations of the particles which are in interaction according to the law $V(|q' - q''|)$ are given in the HARTREE-FOCK approximation. They correspond to the steady case. Formulation of the problem in the form of an operator is carried out by transition from the matrix elements to the corresponding operators. The advantages of this method are due to

Card 1/3

PA - 2066

Quantum Corrections to the THOMAS-FERMI Equation.

the independence of the equation thus obtained from the type of the representation, and besides, computation is considerably simplified. In order to find the operator corresponding to the density matrix, the filling-up operator is introduced, the spectrum of which consists of the filling-up number. By transition to electrostatic interactions of the particles operator equations are obtained which are equivalent to the quasi-classical system of equations mentioned above. The newly obtained system of operator equations represents the explicit solution of the system of equations mentioned above. The importance of the computations now lies in the realization of functions of a sum of non-commuting arguments. If this non-commutability can be neglected, i.e. in the quasi-classical case, the THOMAS-FERMI and THOMAS-FERMI-DIRAC equations follow from the last found system of equations.

The quantum corrections of the order \hbar^2 and \hbar^4 to the THOMAS-FERMI equation are computed by development in series according to the commutators of the terms of the HAMILTONIAN. Correction terms of the \hbar order do not exist. Also the correction to energy due to quantum-like effects is computed.

Card 2/3

PA - 2066

Quantum Corrections to the THOMAS-FERMI Equation.

The energy of the atom according to the statistical model:

The quantum correction of second order furnishes a contribution of ~ 20 to ~ 30% to the energy. For the accurate determination of the correction of fourth order the quantum-like exchange corrections must be taken into account and an extensive class of trial functions must be used in order to increase accuracy. An appendix deals with the realization of functions of non-commuting arguments.

KRIZMAN, M.G.

EXCERPTA MEDICA Sec.2 Vol.11/5 Physiology, etc. May 58

1896. A QUANTITATIVE ESTIMATE OF FREE AMINO-ACID INCORPORATION INTO ISOLATED PROTEINS (Russian text) - Krizman M. G., Sukhareva D. S., Samarina O. P. and Konikova A. S. Inst. of Surg., Inst. of Therap., Acad. of Med. Sci. USSR, Moscow - BIOKHIMIIA 1957, 22/3 (449-459) Graphs 6 Tables 4

A linear function was found correlating the values of glycine, tyrosine and methionine incorporation into myosin and serum proteins and the concentration of the respective amino-acid in the medium. This correlation proved valid within a wide range of amino-acid concentrations. The value of cysteine incorporation into the proteins as a function of concentration in the medium varies but insignificantly. The incorporation of free amino-acids into isolated proteins is accomplished at a rate of the same order of magnitude as in the proteins of various biological systems. The high rate of free amino-acid incorporation into proteins is revealed at low concentrations of the protein and high concentrations of free amino-acids in the reaction medium. The rate of incorporation of S-containing amino-acids into myosin is accelerated by ATP.

Cryohydric values of sugar solutions and their viscosity at low temperatures. V. Šimáček and L. Štěpán. *Výzkum povrchového řezání, Praha, Československý Petrzák 3, číslo 6 (1952)*. - Dried sugar (10% soluble content) was successfully employed as a constituent of mixtures used for freezing fruit or other food products by immersion at -30°. By using a 50% soln. of I the authors could save a major part of glycerol and Ba(OH)₂ which are required to keep low viscosity at -30°. The costs of preparing 100 t. of the freezing mixt. were thus reduced to 90%.

763 Polarographic determination of nitrites and
nitrate in meat-pickling solutions. I. Nitrite and
Nitrate. (Obratov and Ponamov, 1953, 6 [3], 283-
289). Referencing: Zh. Khim., 1954, Akad. Nauk.

16849 - For the determination of nitrate, the
method of Kolthoff et al. (*J. Amer. Chem. Soc.*, 1944,
66, 1782) is used. A soln. containing 1 per cent.
of the sample together with KCl (0.1 M), HCl
(0.01 M) and uranyl acetate (0.0001 M) is polaro-
graphed at -1 V. A soln. of KNO_3 (0.001 M) is
used to prepare a calibration curve. For the deter-
mination of nitrite, 0 ml of 10 per cent. acetic acid
soln. are placed in the cell and nitrogen is blown
through. One ml of a 10 per cent. soln. of the
sample, free from atmospheric oxygen, is then
added, the soln. is mixed and then polarographed
at -0.0 V, the addition method being used. When
nitrate is being determined in spent soln., proteins
must first be precipitated with ethanol and then
removed by filtration. In the nitrite determination
on spent soln., the proteins are ppd. by acetic acid
and the use of ethanol is unnecessary.

1728. Improving rational analysis.—V. Lach and J. Kálová (Starke, 26, 812; 1950). The 5 principal groups of rational analysis methods, those based on Hordel (H_2SO_4 digestion), on Kalkaner-Matejka (heating to 700° C. and subsequent HCl digestion) and all other methods are listed. The advantages and disadvantages of methods 1 and 2 are pointed out and discussed. Because the Kalkaner-Matejka method gives almost correct hematite yields and iron is dissolved by cone. H_2SO_4 , the authors combined both methods. The results obtained when many Bohemian haematites and clays were analyzed are given and compared with the results of chemical analysis. The agreement in the haematite group was almost perfect, in the clay group also the errors were very small. The method used gives better results than the others but is much lengthier and more laborious. (Editor's Note: The method appears similar to that first proposed by Koppeler.) (I f.g., 3 tables.)

AUTHORS: Rák Kálmán, Krizsa Frerenc, Sövényi Ervin, Cserháti István (Doctors)

TITLE: The effects of ultraviolet therapy on the survival of X-ray irradiated mice

PERIODICAL: Magyar Radiologia, no.1, 1962, 48-51

TEXT: It was observed by the authors that exposure of the entire body of mice to 300 r X-rays after treatment by U.V. did not produce thrombocytopenia. After massive X-ray doses (500, 550 and 600 r), the percentage of survival was significantly greater if U.V. therapy was performed 24 or 48 hours previously, and the number of survival days in single animals was also augmented. Several data show that the thrombopoetic action of U.V. irradiation was not coupled with the same effect of the serotonin. It is very likely that ultraviolet radiation has a protective effect against X-ray injuries.
